

A high-angle, wide shot of a laboratory or office space. A person in a white lab coat is seated at a desk on the left, working on a computer. The desk is cluttered with papers, a printer, and other office equipment. In the center, there is a large, curved workstation with a microscope and other diagnostic equipment. To the right, there are more desks with various machines, including what appears to be a centrifuge and a large piece of equipment with a circular opening. A window with a grid pattern is visible on the left wall, providing natural light. The room is brightly lit by overhead fluorescent lights. The overall atmosphere is professional and clinical.

Advanced diagnostic methods in hematology

**Michal Gniot
Department of Hematology
Poznan University of Medical Sciences**

Hematological neoplasms

- **Clonal growth of cell population originating from myeloid or lymphoid lineage**
 - Somatic mutation
 - Neoplastic cells circulating in peripheral blood
 - Possible abnormalities in cell maturation
- **Examples:**
 - Leukemias (acute and chronic, myeloid and lymphoid)
 - Myeloproliferative neoplasms (Polycythemia Vera, Idiopathic Myelofibrosis, Essential Thrombocythemia)
 - Lymphomas, myelomas

Hematological neoplasms – background

- **Somatic (acquired) mutation**
 - **Region encoding a protein which plays a role in cell signaling pathway**
 - **Change of function (usually - activation)**
 - **Point mutations, insertions-deletions, translocations**
 - **Translocations result in fusion genes**

Flow cytometry

Flow cytometry

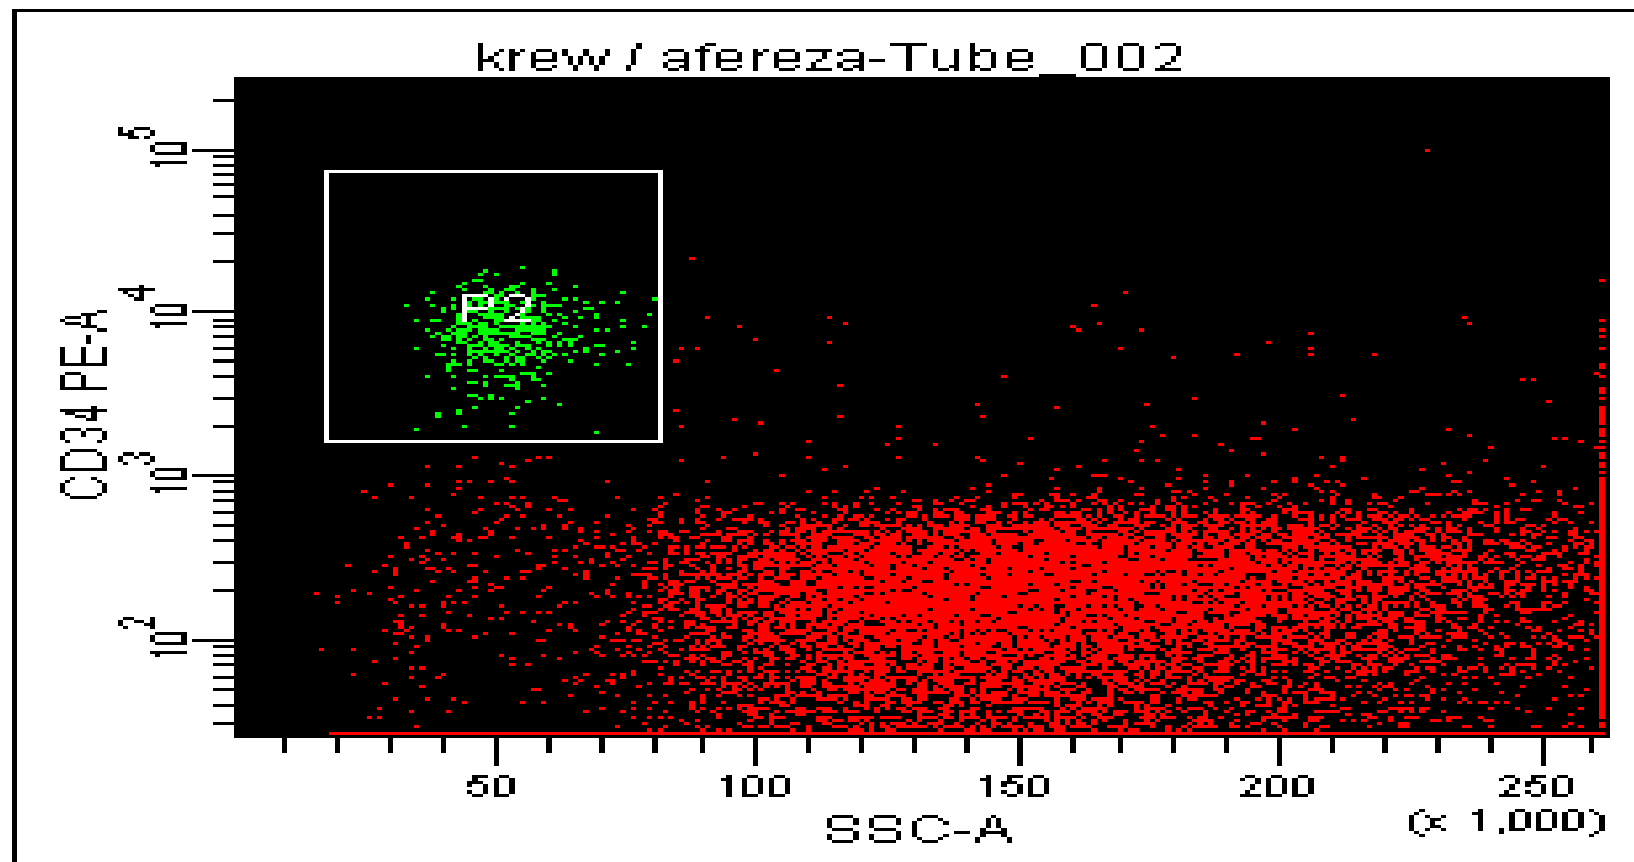

- Characterisation of hematopoietic cells in blood, marrow, CSF, exudates
- Immunophenotype describing
- Separation of cells with specific antigenity (e.g. CD34+ stem cells for transplatations)

Examples:

T-helper lymphocytes (CD3+ CD4+)

CD34+ cells

	MYELOID LINEAGE		LYMPHOID LINEAGE

MARKER	DESCRIPTION
CD3	Pan T-Cell
CD4	Helper T-Cell
CD8	Cytotoxic/Suppressor T-Cell
CD19	Early B-Cell, B-Cell Specific
CD33	Early Myeloid Cells
CD34	Stem Cells, Progenitor Cells
CD38	Activated T-Cells, Early Progenitor Cells
HLA-DR	Activated T-Cell, Monocytes, B-Cell

Cytogenetics

- **Classical cytogenetics require culturing of bone marrow cells in order to obtain nuclei in metaphase stage.**
- **The chromosomes are stained using GTG (or other) banding method, photographed and analyzed in dedicated software**
- **Usually, 20-30 metaphases has to be assessed in comparison to normal human karyotype**
- **Molecular cytogenetics, FISH method (Fluorescent In-Situ Hybridization) is a supporting method, which allows to detect specific aberrations**

Aims of cytogenetic analyses

- Detection of chromosomal abnormalities characteristic to: MDS, AML, ALL, CML ...
- Observation of new, acquired abnormalities (clonal evolution)
- Prognostic factors (i.e. additional aberrations in CML)
- Monitoring of the therapy
- Post-transplantation chimerism of Y-X chromosomes

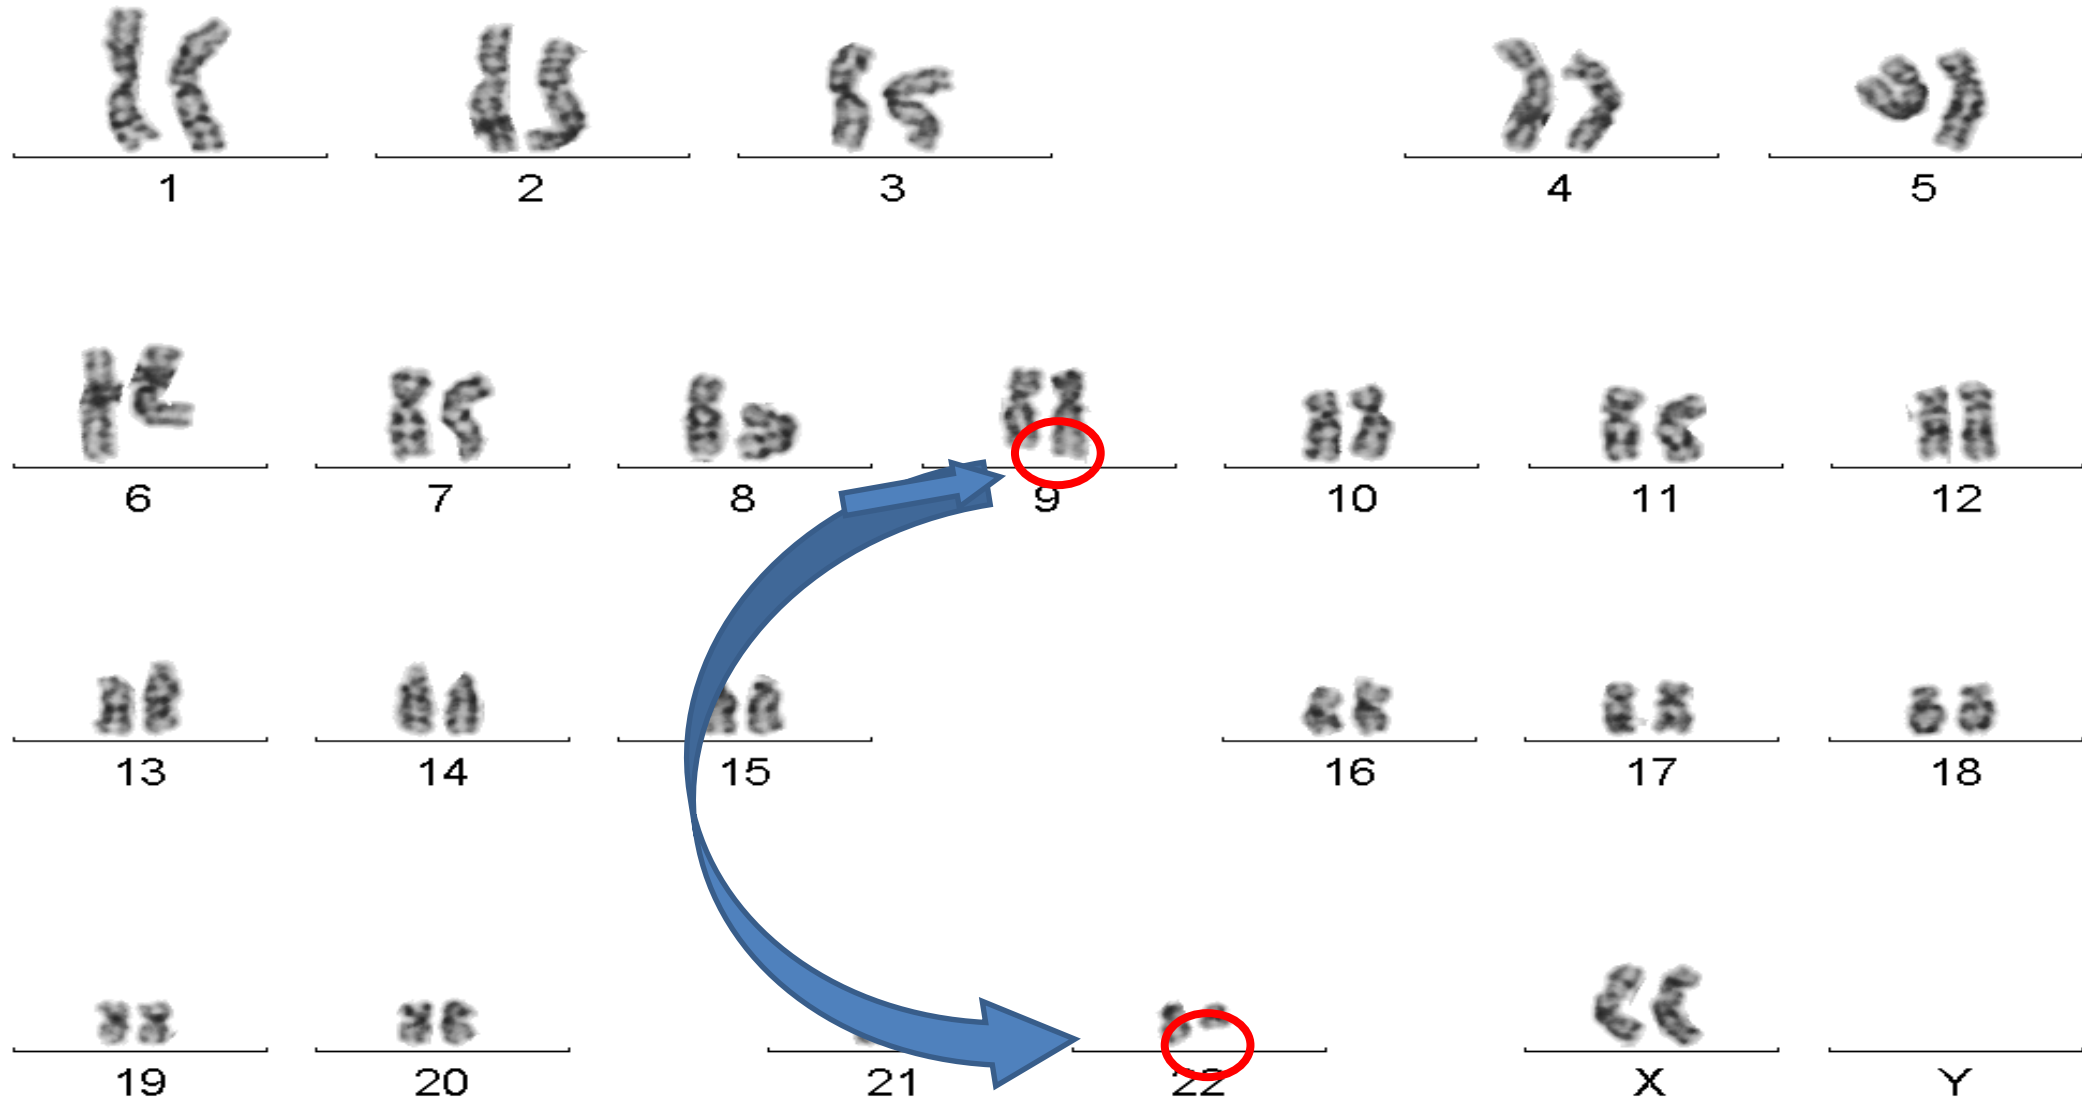

t(15;17) – PML-RARA in AML M3

5q-

t(9;22) – Philadelphia chromosome

t(9;22) – FISH analysis

Polyploidy

Molecular biology

- Detection of specific molecular abnormalities
 - Fusion genes
 - Point mutations
 - In-del mutations
- Treatment monitoring
- Prognostic factors
- Most sensitive method for MRD monitoring*
- Post-transplantation chimerism

Main areas of interest

Diagnose

Classification criteria

Prognostic factors

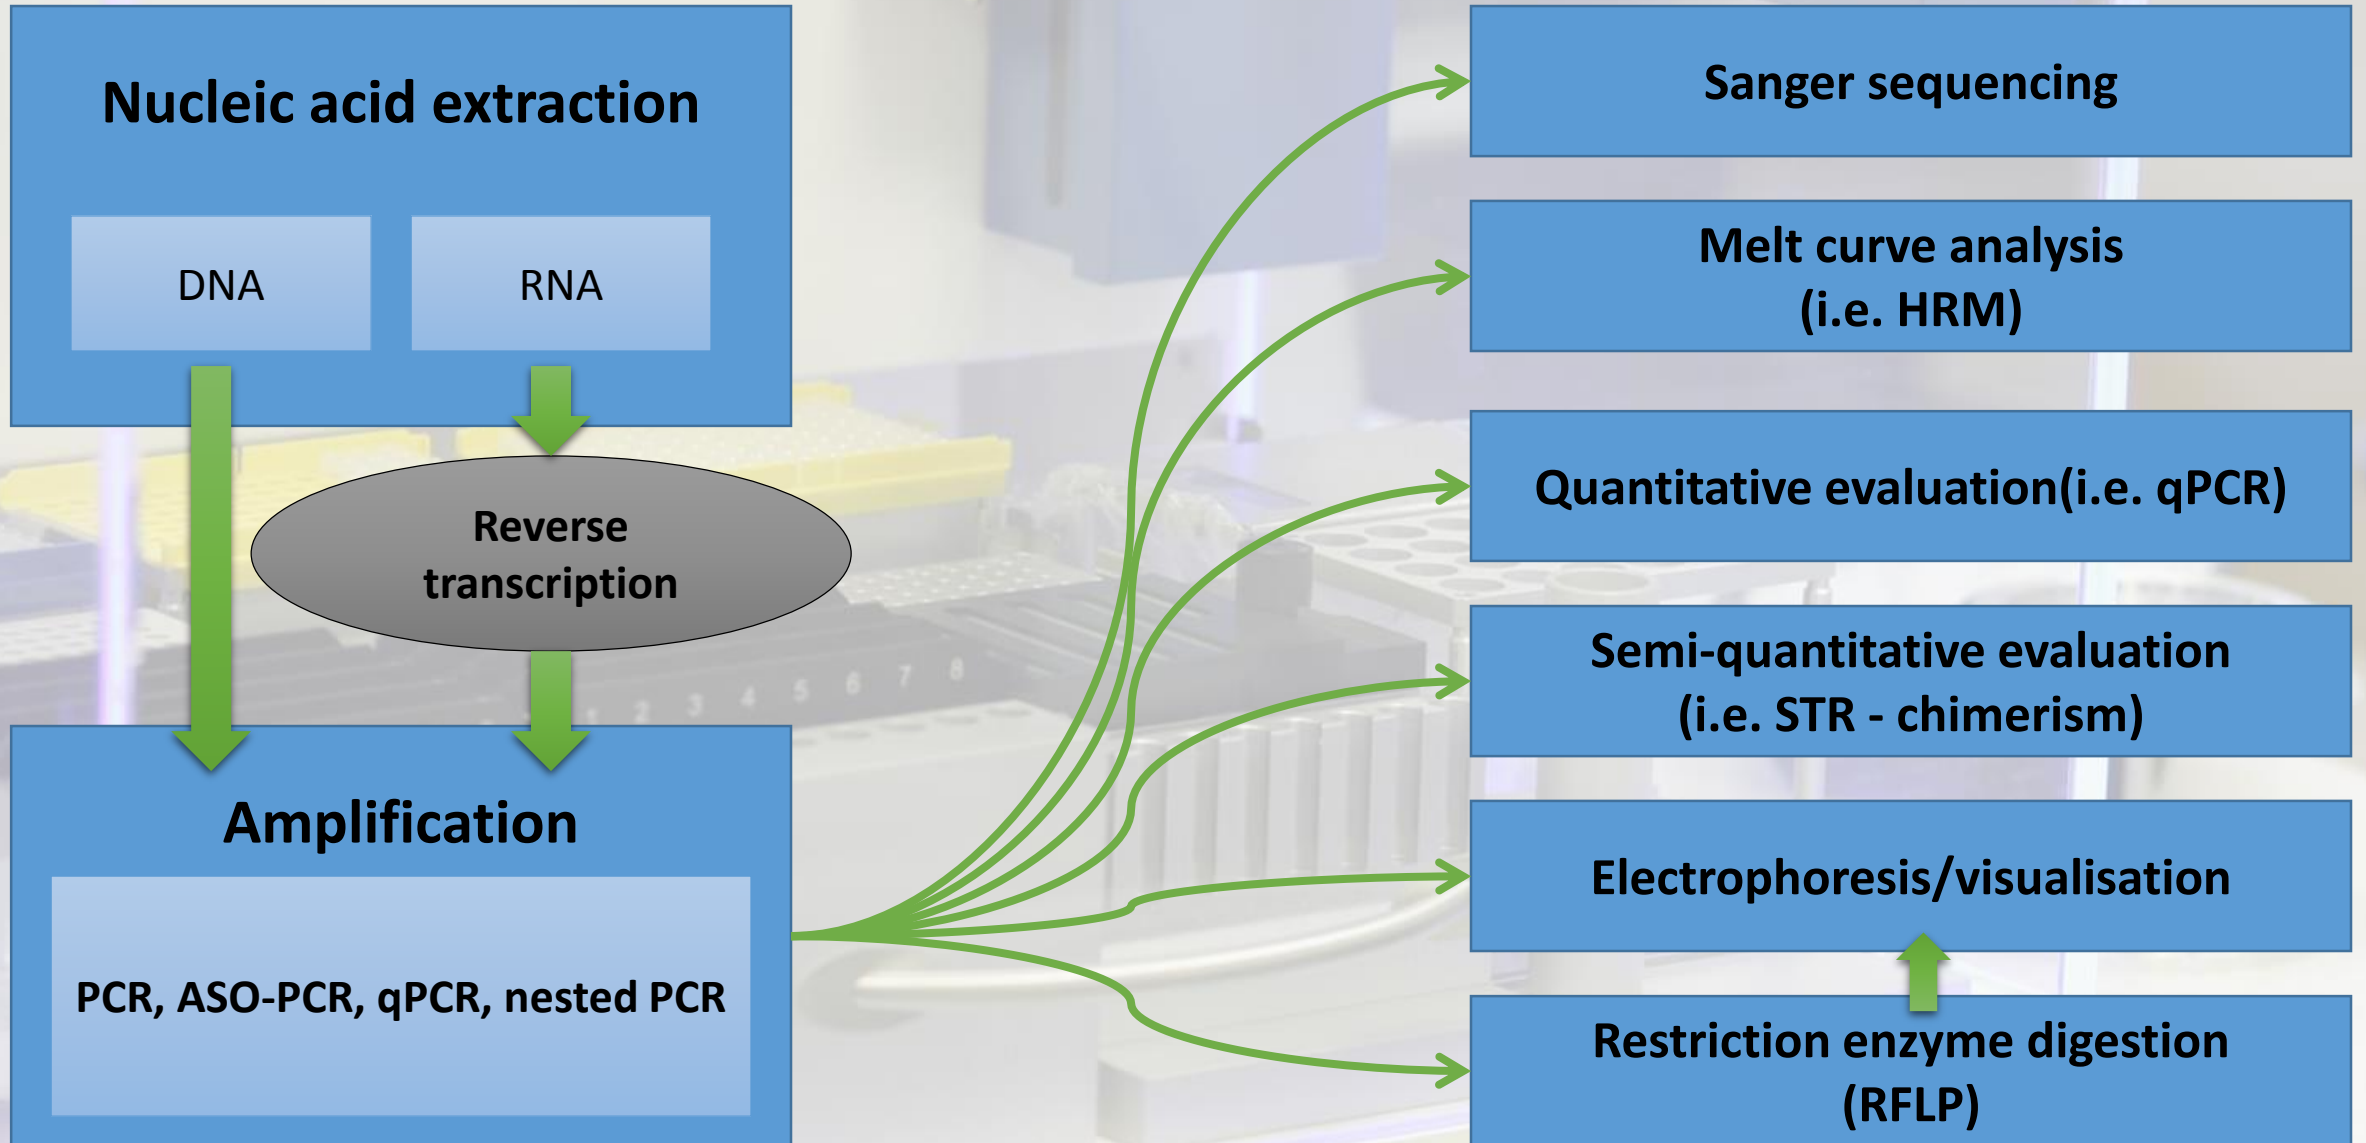

Identification of molecular targets

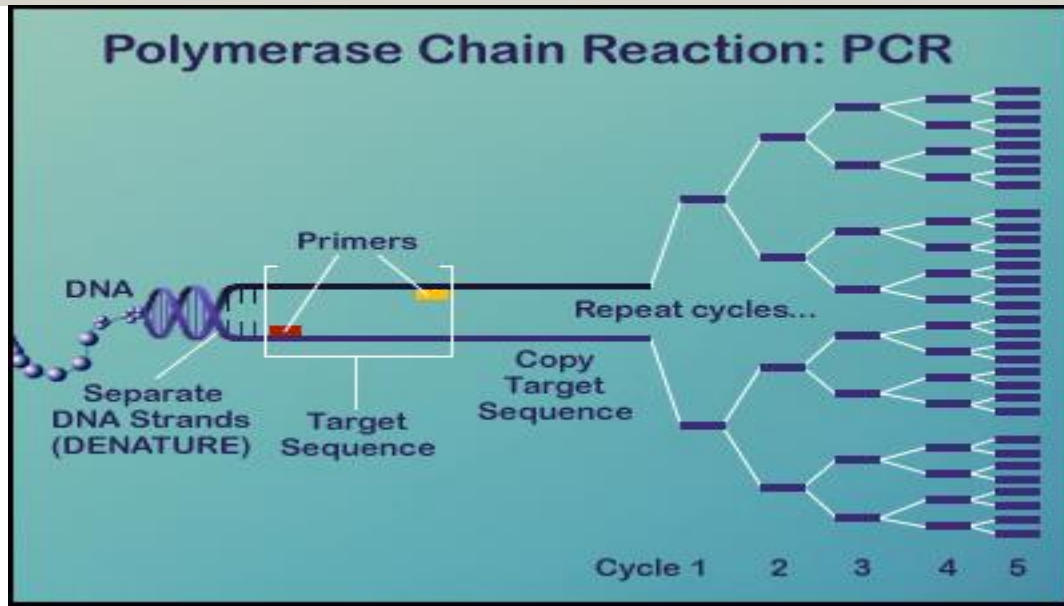

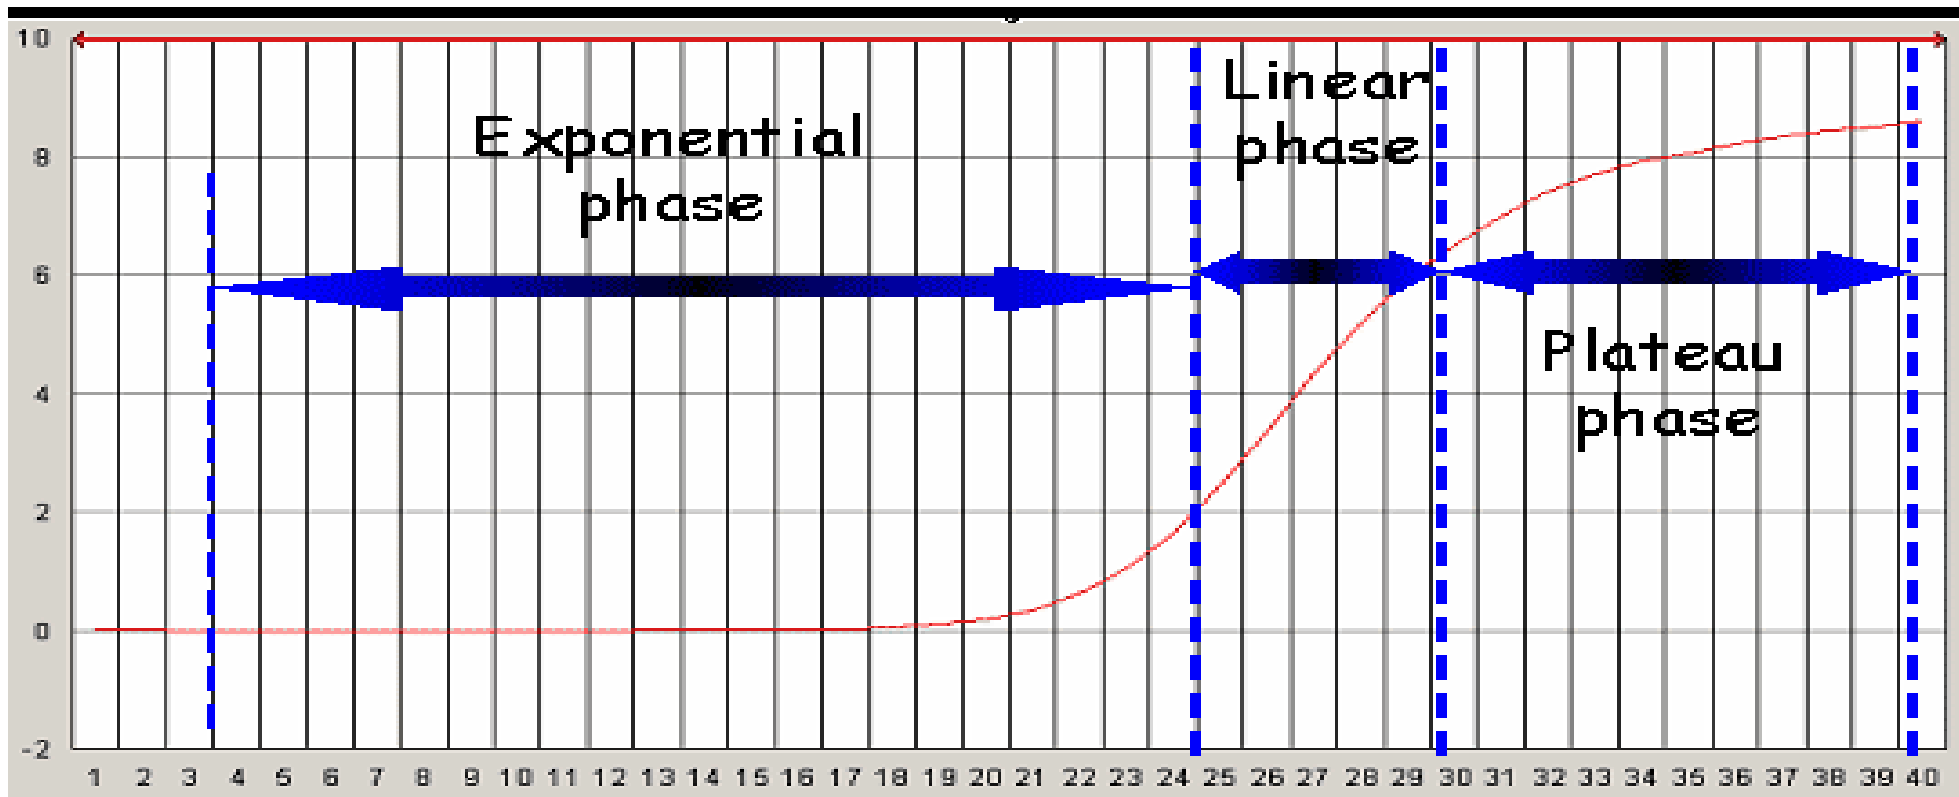

Monitoring

Based on a specific genetic marker
detected at diagnosis

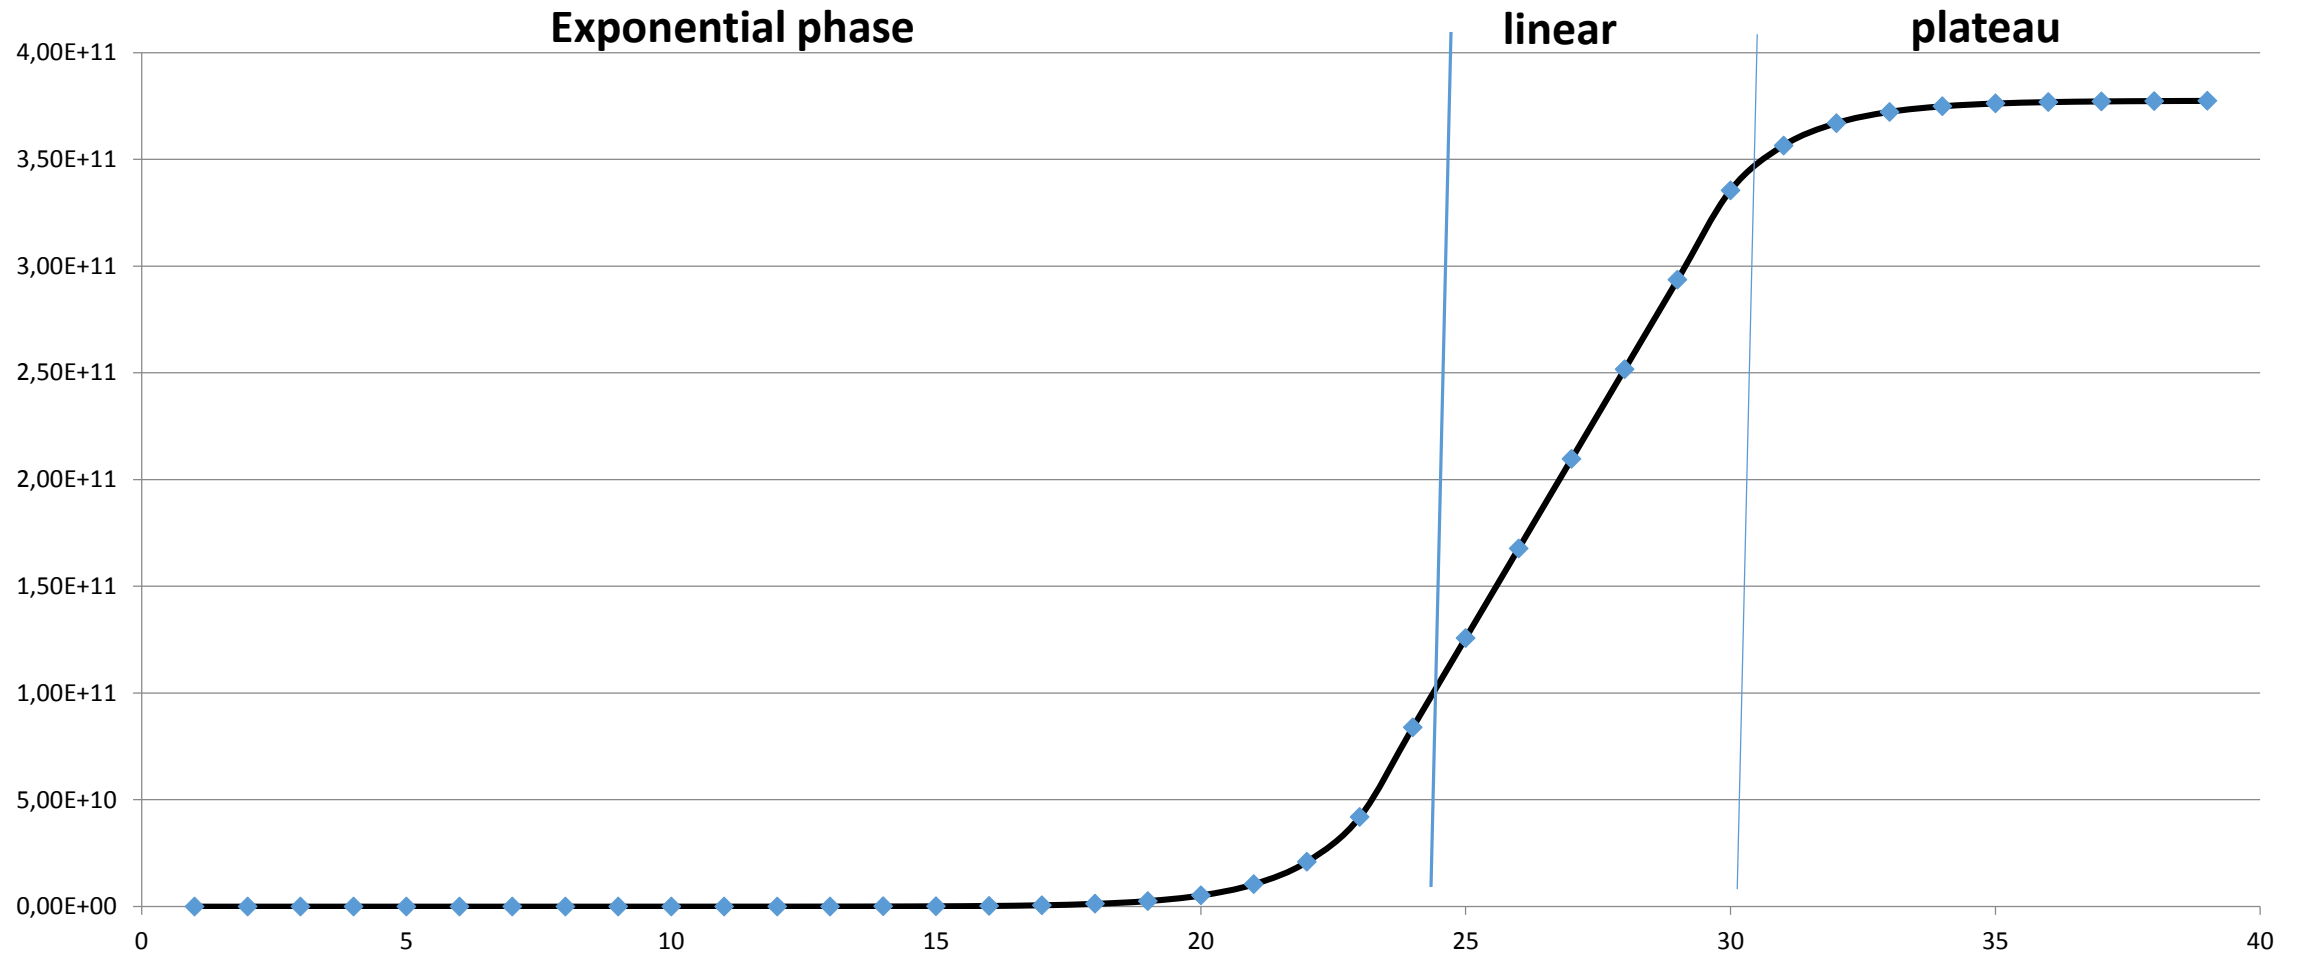

Chimerism
(donor vs recipient comparison)

Molecular biology strategies

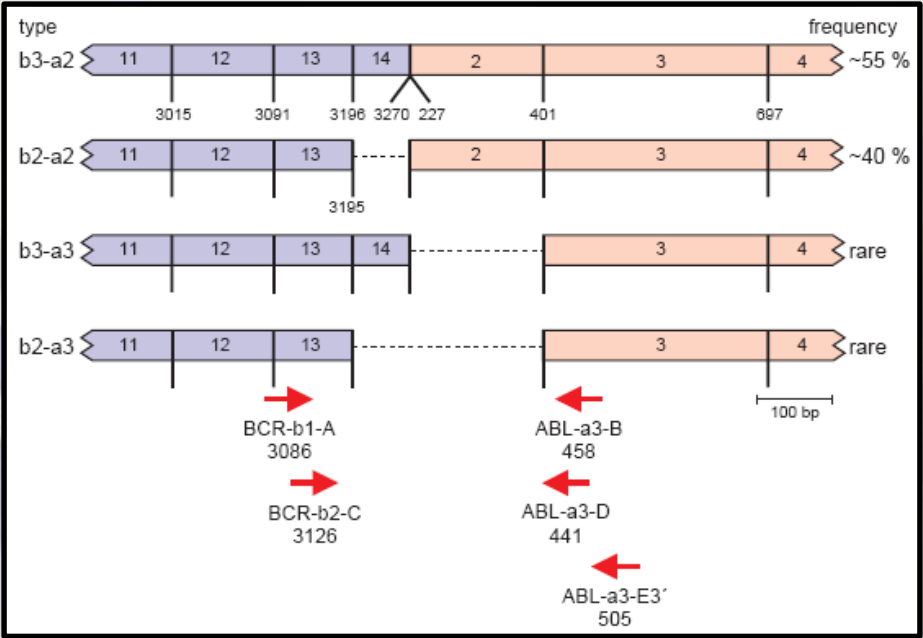

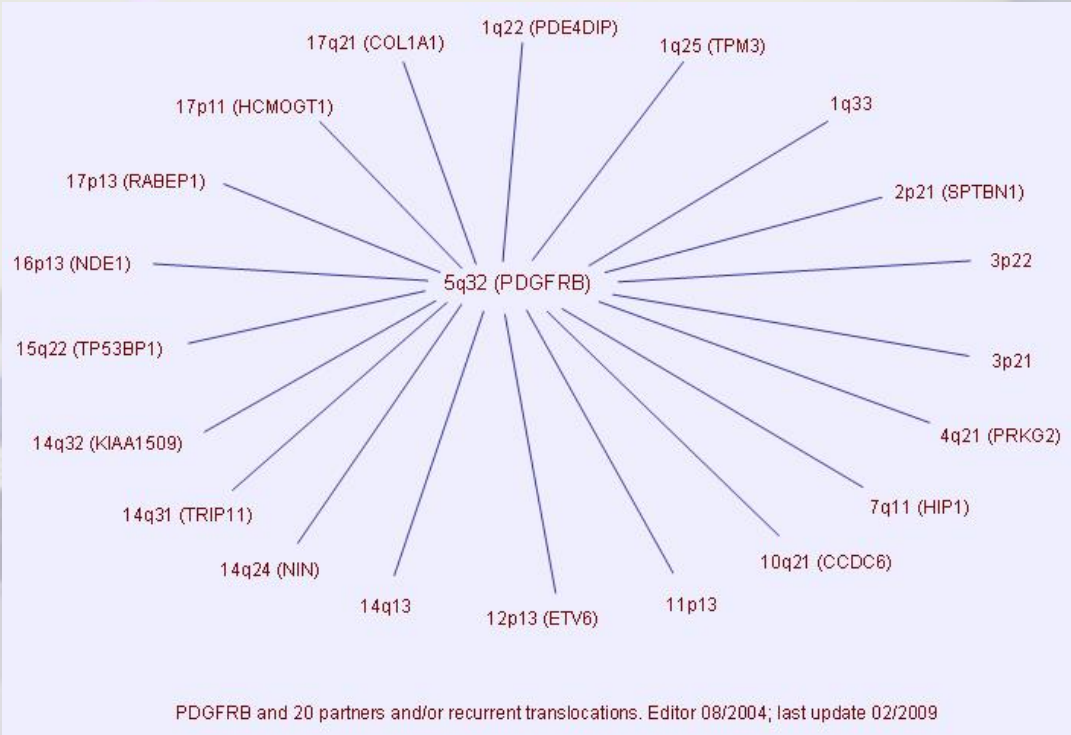

Kinetics of PCR

Fusion gene detection

Fusion gene detection

Fusion genes:

- TEL-AML1 (PCR)
- E2A-PBX (PCR)
- MLL – rearrangements (multiplex PCR)
- SIL-TAL (PCR)
- BCR-ABL (multiplex PCR)
- AML1-ETO (PCR)
- PML-RARA (PCR)
- CBFβ-MYH11 (PCR)
- FIP1L1-PDGFRα (PCR)

Other mutations:

- JAK2 V617F (ASO QPCR)
- JAK2 ex12 (HRM/CE/SEQ)
- MPL (HRM/SEQ)
- CALR (HRM/CE/SEQ)
- FLT3 ITD (CE)
- FLT3 TKD (RFLP)
- BRAF V600E (ARMS PCR)
- CEBPA (SEQ)
- Post transplantation chimerism (CE)

To be introduced: ASXL1, LNK, CS3FR

TKI resistance in CML

- Primary resistance – no significant improvement after introduction of TKI therapy
 - Usually not related to BCR-ABL kinase domain mutations

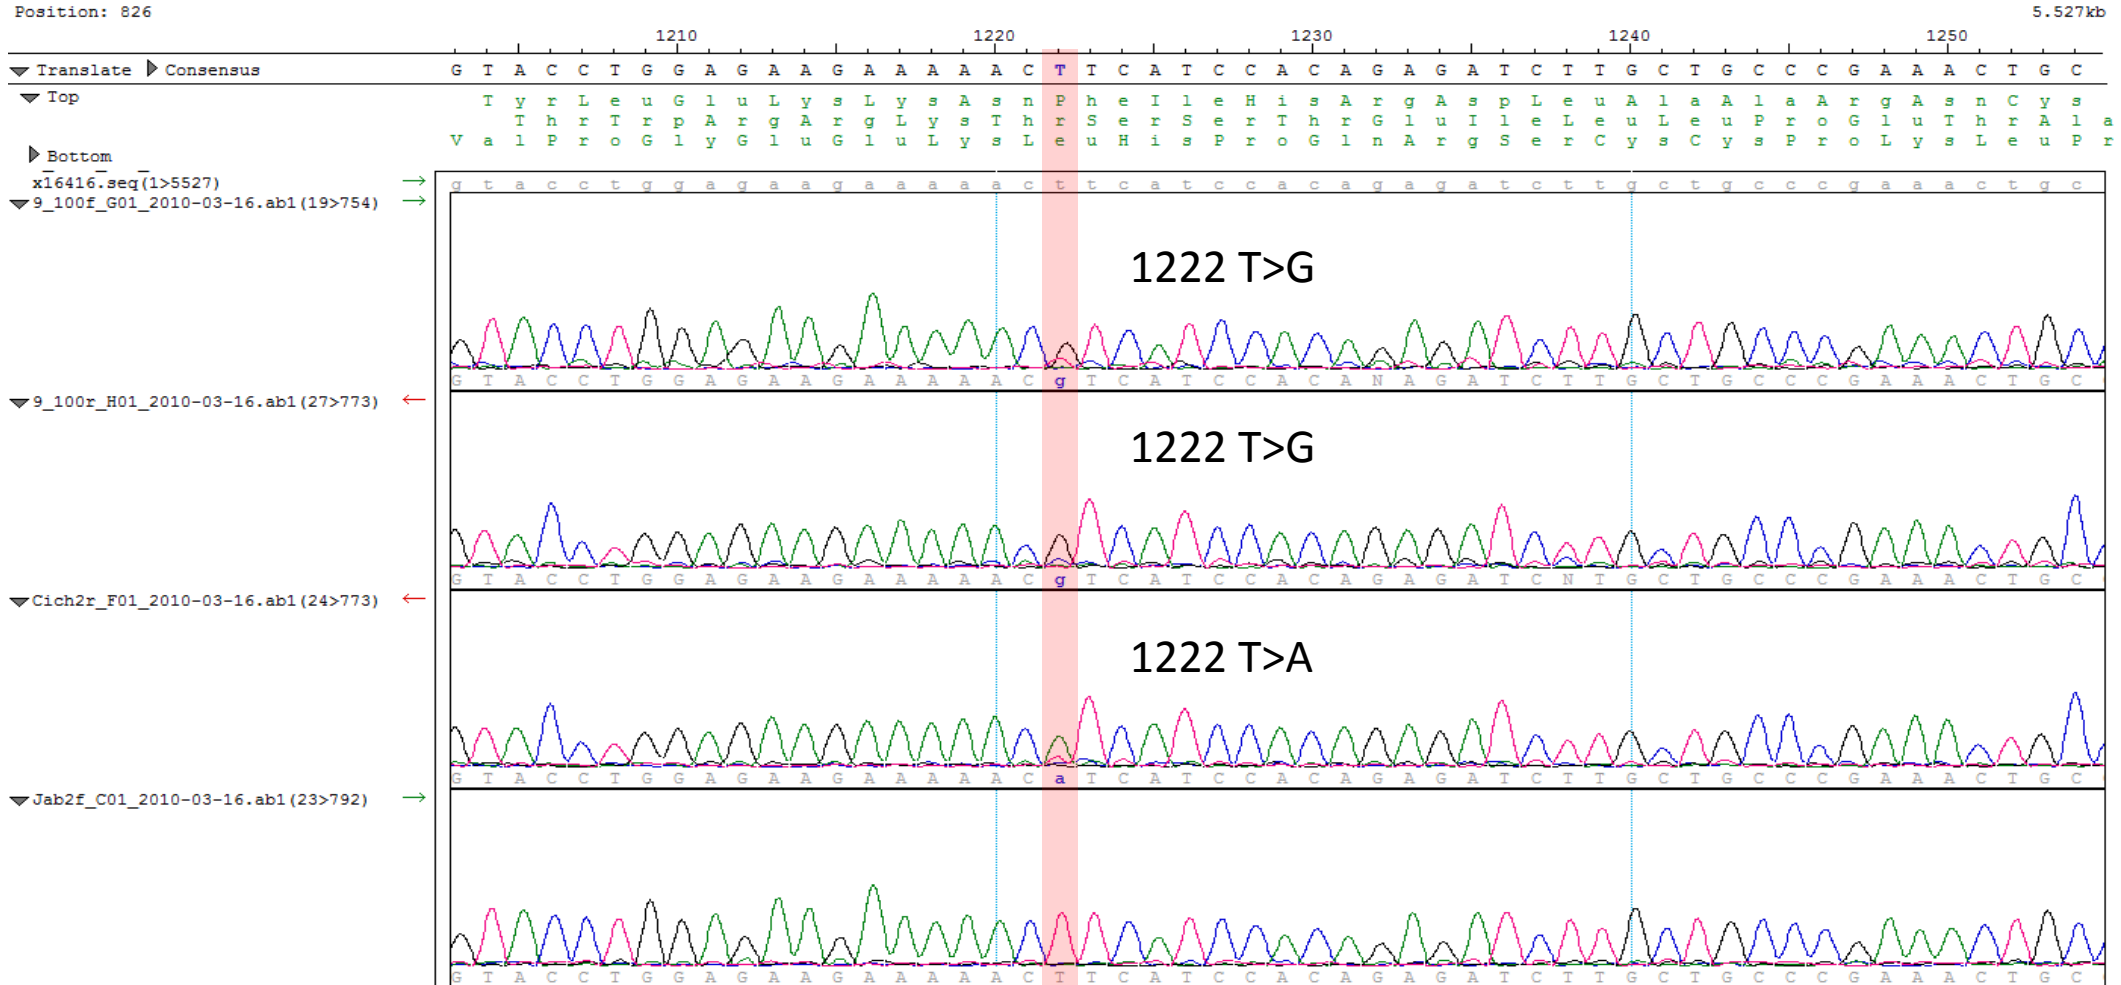

TKI resistance in CML

- Acquired resistance – an increase of BCR-ABL transcript level after an initial reduction
 - Approx 50% of cases are related to BCR-ABL KD mutations
 - Before sequencing of BCR-ABL KD we have to be sure that patient has taken a full dose of TKI!

VDJ rearrangements

- Mechanism of recombination which occurs on early stage of lymphocyte development
- Plays role in forming of **antibodies (B-cells)** and **T-cell receptors (TCR)**
- VDJ recombination – name derived from regions participating in rearrangement
 - V – variable, D – diversity, J – joining
- In lymphoid malignancies, it can be used as the clonality marker
- Clonal rearrangements can be detected with molecular techniques
- Once detected, certain rearrangement pattern **can be used for MRD monitoring with ultimate sensitivity**
- Due to the complexity of the problem, highly specialized laboratory is required for this analyses
